

## ABSTRACT OF THE DISCLOSURE

An apparatus and method for display signal strengths of every channel of a digital broadcast receiver are disclosed. Channels for broadcast signals are sequentially scanned from a tuner receiving a digital broadcast signal, and channel numbers, the number of channels, signal strengths of each channel, and the sum of signal strengths of the entire channels are outputted in an OSD (On Screen Display) form or as a voice. Thus, a user can objectively set an optimum direction of an antenna for every channel.
